

Redco™

CUSHION PADS FOR PILE DRIVING

Made of Redco™ Polyurethane, Redco™ Phenolic or Redco™ Cast Nylon, these cushion pads will absorb the initial hammer shock while transferring the striking force into the pile.

Redco™ Pile Driving Pads reduce the tremendous wear and stress on the hammers by absorbing the shock, thereby, minimizing breakdowns and downtime.

Redco™ cushion pads which are placed within the "helmet" between the crane hammer and the concrete or steel pile, also protect the pile and your equipment from costly damage and nonproductive downtime.

Cushion Pads have proven themselves in all types of pile driving applications. Redwood Plastics has the ability to fabricate pads to your specifications.

Redco™ Phenolic Cushion Pads provide tremendous impact resistance and stability while absorbing shock. It provides good wear resistance, low moisture absorption, and good mechanical strength at economical cost.

Redco™ Nylon offers high tensile strength with shock, impact and wear resistance as well as low moisture absorption.
